

## Suggested Applications:

- Pilonidal Cyst incisions
- Spinal incisions

...and discovering more applications all the time

DermaHug improves patient satisfaction while reducing costs. Every hospital and/or clinic is concerned about money. When utilized, DermaHug actually reduces cost while improving patient outcomes and patient satisfaction, because it can be worn continuously for several weeks.

When soiled, it can be removed, washed with mild soap and water, patted dry and reapplied. DermaHug is made of a siliconized nylon/spandex material. It was originally designed to aid healing of pilonidal cyst incisions. Intended to go over the sterile wound dressing covering the incision, the DermaHug R514 acts like a shock absorber, stabilizing tissue and minimizing movement around the wound. Most importantly, because the DermaHug R514 minimizes movement, fibroblasts remain intact. Patients report being significantly more comfortable when the DermaHug R514 is utilized.
