

Your patients will love the comfort and feel of DermaHug extended wear wound dressing covers which stabilize the wound site and aid healing

How They Work:

DermaHug products are applied over the sterile wound dressing to stabilize the tissue surrounding the wound or incision while minimizing movement. Limiting the movement of the tissue around the wound aids healing by reducing the disruption of fibroblasts, further enabling the healing process. DermaHug can remain on the patient continuously for several weeks. They are very gentle on the skin and conform to the body shape. They are adjustable, hydrophobic, and can be worn in the shower. They are so comfortable, most patients forget they are wearing it.

No Skin Graft

Benefits of DermaHug:

- Stabilizes wound/incision
- Enhanced patient outcome
- Can be adapted to fit any shape
- Improves healing environment
- Reduces incisional pain, thus reducing the need for pain meds and appliances
- Silky, won't bind in clothing
